

Configuring Supply Codes and Units

Barnestorm Office > Codes > Rates > Supply Codes

When entering new supplies or adjusting existing ones, it's essential to configure the unit types and conversion settings correctly. Here's a guide to help you understand how each unit field works and how conversion factors apply across various Barnestorm screens.

Ordered from vendor by the	CS	Order Cost \$	55.00	/ CS
Stocked by the	PACK	Cost \$	5.50	/ EA
Billed by the	EA	Price \$	6.54	/ EA
1 CS = how many PACK	5	*Price Markup is 3.00		
1 PACK = how many EA	2	...Date...	...Cost	..Price
		09-01-2007	5.50	6.54

Supply Units

Each supply item includes three-unit types to ensure accuracy in inventory, requisitions, and billing:

- **Ordered from the vendor by:** This unit appears only on the Supply Inventory screen. It reflects how you receive the item from your vendor (e.g., cases, boxes).
- **Stocked by the:** These units appear on:
 - Supply requisitions
 - New visits and assessments in Point of Care

This unit helps field staff and supply coordinators understand how to enter quantities.

Example: If diapers are set as EACH, it can be unclear whether that

means individual diapers or packs. To reduce confusion, you can set this unit to PACK for clarity.

- **Billed by the:** This is the smallest unit used for billing. All inventory and requisitions are ultimately converted to this unit for billing purposes.

Supply Conversion Factors

Conversion factors bridge the gap between how an item is ordered, stocked, and billed. These are automatically applied throughout the system to ensure consistency.

Where conversion factors are used:

1. Supply Inventory screen
 - Inventory is entered using ordering units
 - Converted to stocking units using the *Order conversion factor*
 - *Example:* 4 cases entered \times 5 packs per case = 20 Packs in inventory
2. Approve Supply Requisitions screen
 - Converts stocking units to billing units
 - *Example:* 10 Packs \times 2 = 20 billing units
3. Supply Import screen

Configuring Supply Codes

- Used when importing visit supply data
- *Example: 7 Packs used on a visit \times 2 = 14 billing units*

Supply Costs and Prices

- Order Cost: Used on the Supply Inventory screen to reflect what the vendor charges per ordering unit.
- Cost (Billing Unit): Used on year-end supply cost reports to reflect cost per billed unit.
- Price: The patient-facing charge per billed unit.

Deleting a Price

If a price was added by mistake:

- Select the entry in the pricing list
- Click Delete
- No confirmation will appear — deletion is immediate

Summary

Configuring these unit fields and conversion settings correctly ensures:

- Accurate inventory tracking
- Proper billing

Configuring Supply Codes

- Clear and consistent data entry for staff

If left unconfigured or inaccurate, you risk underbilling, especially with items like tape billed by square inch. To prevent errors, we recommend filling in these settings after an inventory count is completed.
