

Enter HbA1c Results

You can track the HbA1c levels in Barnestorm Office or Point of Care.

The patient must have a diabetes diagnosis code in order to track the levels. If the HbA1c screen does not appear for you, check the patient's ICD History to verify they have a diabetes diagnosis code.

The entire history will show up on the patient's 60 Day Summary (from the Patient Info screen).

Barnestorm Office: after selecting the patient from the **Select Patient** screen click on the **Visits / Assessments** tab and then select the **HbA1c** button. The button will be yellow for diabetic patients and gray for non-diabetic (based on ICD History).

Point of Care: within a visit click on the **Endocrine** tab then click the **HbA1c** tab towards the top.

- o Once you start to key in the levels, this screen will display how long it's been since the most recent results.
- o Select the lab date and key in the results, either the percentage or the mmol/mol value. Value must be at least 3 or higher.
- o Click on Add.
- o If you keyed in an incorrect value, select the value, change the results and click on Replace.
- o To delete an entry, select the value and then click on the Delete button.
